

ECHOES

Enabling Cultural Heritage Oriented European Strategies

Open discussion (topic 3):

Developing and disseminating
innovative decision-support tools to promote exploitation of
advanced/enabling technologies
in cultural heritage prevention, conservation and restoration

Andrea Porcari (Airi), Elena Semenzin (Unive)
(contact: porcari@airi.it)

Why promoting innovation in cultural heritage prevention, conservation and restoration

*“A **scientific approach** is essential for the conservation of the cultural heritage, as a preliminary basis that will ensure **effective planning** of ordinary and extraordinary maintenance works, as well as to assure their **efficacy and durability**”*

Business Plan, CEN TC 346 – Conservation of Cultural Heritage

*Although the conservation of cultural heritage involves a different **code of ethics**, it can be compared to medicine, where artifacts are analogous to patients and conservators are similar to doctors*

Position Paper, Echoes Cluster

**An evidence and ethics based approach
is needed for decision-making in innovation
in the cultural heritage field**

Challenges to introduce innovations in the cultural heritage sector

- Wide diversity in terms of substrates, methods and techniques, ways of applications
- Stringent ethical requirements (“Conservators need to be conservative”)
- Need to work on a case-by-case basis

- Long experienced professionals, working with their own consolidated techniques
- Strong preference for well-known products & skepticism or lack of knowledge on new technologies
- Lack of “quality” certifications
- Labour intensive activity

- Limited production volumes
- Fragmented sector in terms of needs and players (e.g. having different missions, targets and size)
- Strong impact of the socio-economical context
(on choices for prevention, restoration and conservation)

Complexity of evaluation criteria (examples from NanoRestart)

Economical

Feasibility

Costs/affordability

Cost effectiveness

Intervention time reduction

Performance/efficiency

Market size

Durability

Technological

Performance/efficiency

Selectivity

Removability, reversibility

Reliability

Sensitivity

Long term impacts

Technical bottlenecks

Social/Ethical/Legal

Compatibility

Reliability

Reversibility, re-treatability

non-invasivity

Ageing of the treatment

Long term impacts

Need for training

Users and consumer perception

Safety/ Environment

Operator Health and Safety

Safety risks (e.g. workers, users)

Environmental impacts

An innovation value chain perspective: a variety of actors and needs

Actors:

- Researchers
- Tech developers/producers
- Museums
- Professionals (e.g. conservators)
- Companies (diagnosis, equipments, retail, etc)
- Scientific bodies
- Policy makers, authorities
- Users, society
- ..

Knowledge/support needs (examples):

- conservation challenges, substrates
- tech solutions, materials
- technical, ethical, safety, legal, economic requirements
- (long-term) testing method
- Safety and sustainability procedures
- Quality, advantages compared to benchmarks
- ...

An intervention value chain perspective: a variety of competences

- **Diagnosis** of the works of art characteristics and degradation
- **Definition of requirements** (technical, ethical, legal, safety, environmental and economic criteria)
- **Design of the intervention strategy**: analysis, selection of tech, development of solutions, ways of application and use, selection of mock-ups, product optimization, etc.
- **Customization of the tech solutions**
- **Validation & Testing**
- **Benchmark, monitor** of quality, feasibility, reliability of intervention
- **Training** to professionals and value chain actors
- **Exploitation**, introduction into the market and making it accessible to the wide community

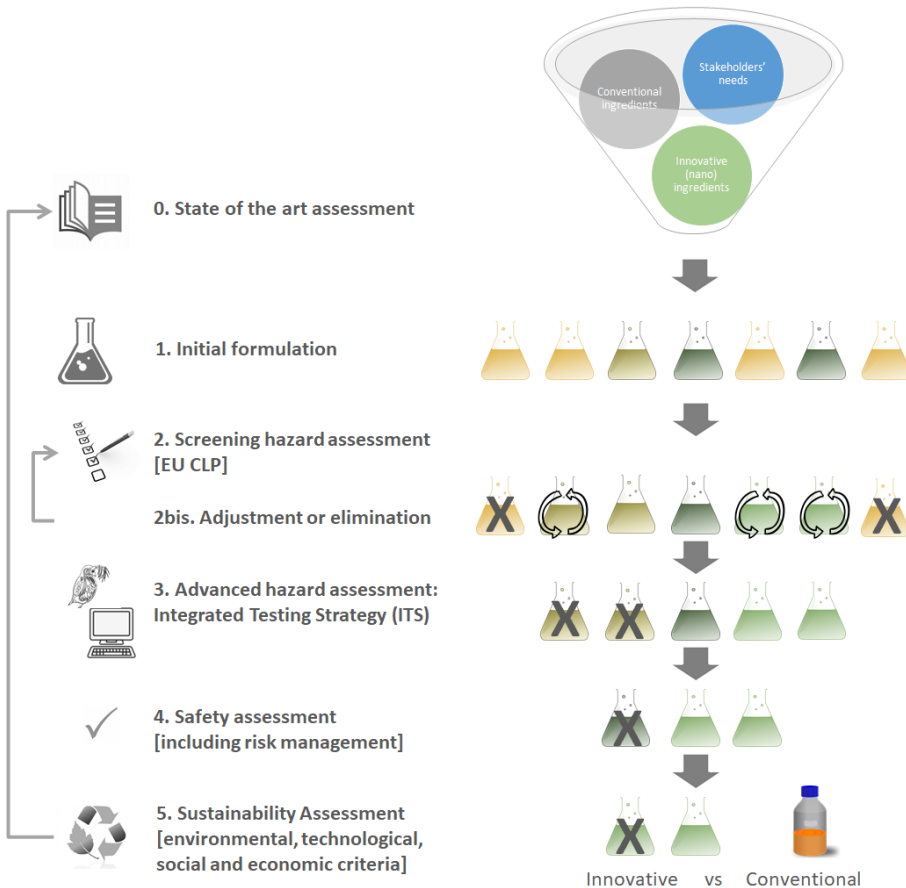

Generally no transparent, structured and reproducible processes in intervention

→ Need to guide the process

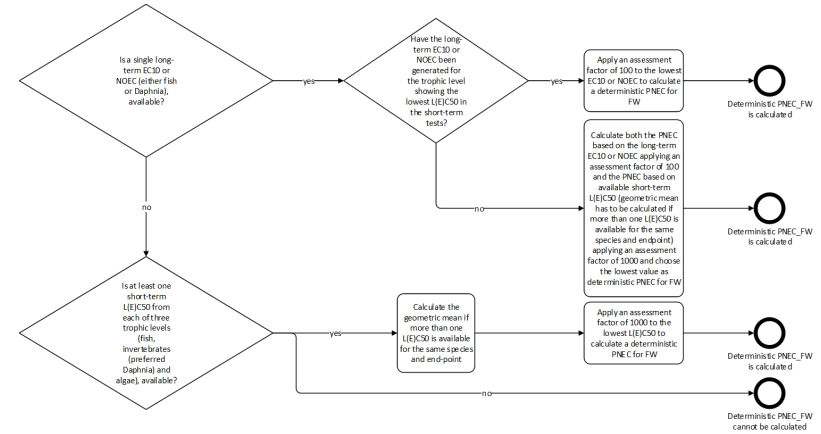

Decision-support tools: some practical examples

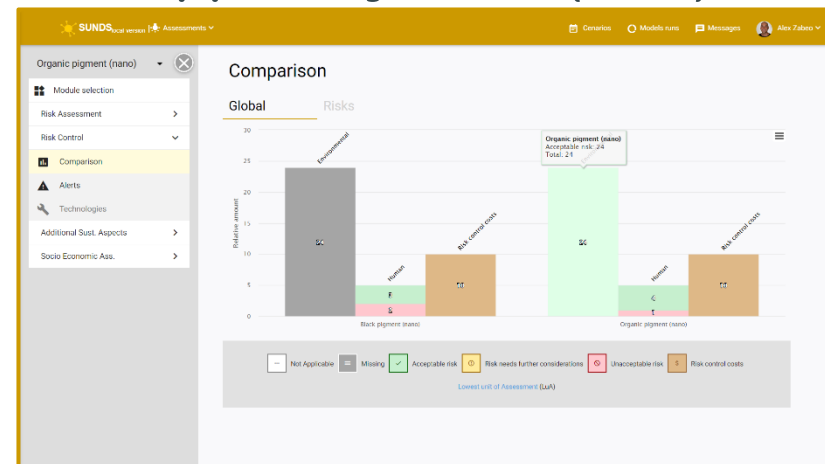

Decisional frameworks

Decision trees

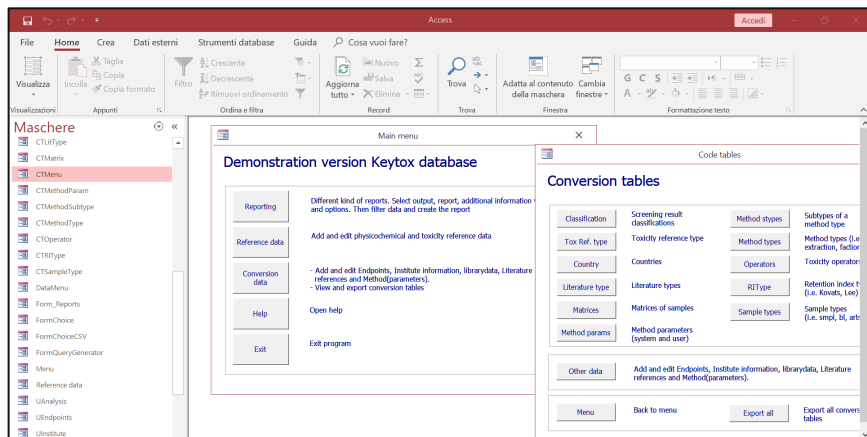

Software-based Decision Support Systems (DSS)

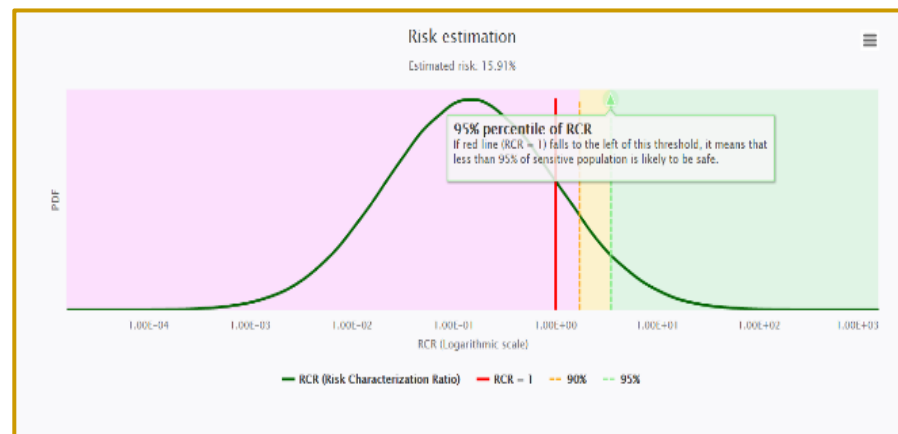

Decision-making tools: some practical examples

Databases/open repositories

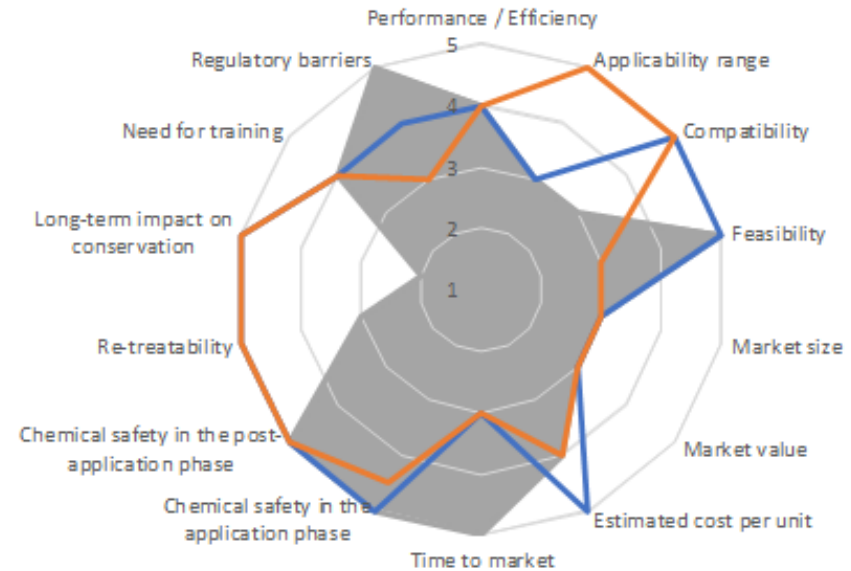

Quantitative approaches/tools

Decision-support tools: some practical examples

		Helpful	Harmful
Internal Origin	STRENGTHS	<ul style="list-style-type: none"> New/breakthrough properties for cleaning, consolidation, protection and sensing Customization capabilities Environmental sustainability and chemical safety 	<ul style="list-style-type: none"> Some products address <u>very specific challenges</u> Additional testing <u>needed</u> for some products
	OPPORTUNITIES	<ul style="list-style-type: none"> Better performances <u>than existing solutions</u> <u>Applicability</u> on a wide range of <u>substrates</u> <u>Matching ethical principles</u> in Cultural Heritage (re-treatability, <u>removability</u>, long-term conservation...) Tech <u>development aligned</u> with EU tech <u>roadmaps/priorities</u> Potential applications <u>beyond Cultural Heritage conservation</u> 	<ul style="list-style-type: none"> Need to increase awareness and confidence on these new technologies
External Origin			

Qualitative/Semi-quantitative approaches/tools

excellent
very good
good
moderate
scarce
poor
bad

Why decision-support tools?

*A model for decision-making in the field is urgently needed. It should provide all actors along the value and supply chain **reliable ways to assess the feasibility and viability of these solutions compared to existing benchmarks.***

NanoRestart Exploitation Plan

Open issues

Developing and disseminating innovative decision-support tools to promote exploitation of advanced/enabling technologies in cultural heritage prevention, conservation and restoration

What priority areas: prevention, conservation, new materials for CH?

What purpose: knowledge base and awareness (e.g. repositories), scientific analysis (e.g. modelling), strategic decision (e.g. tech assessment), consensus and confidence building (sharing, dialogue, standards), market analysis, cultural assets management...

What tools (and good practices) along the innovation and “intervention” value chains?

What targets: harmonization, quality (and minimum quality/reliability requirements),

What actors: researchers, conservators, museums, scientific organizations, artists, ...

What (infra) structures: experts (e.g. consultancy), policy & normative (e.g. local authorities, standard bodies), public- private partnerships.....
